# GE Healthcare

# Ni Sepharose Fast Flow HisTrap Fast Flow HisPrep 16/10 Fast Flow

# Q When should I use the new Ni Sepharose™ 6 Fast Flow instead of Ni Sepharose™ High Performance?

A The new Ni Sepharose 6 Fast Flow and Ni Sepharose High Performance are optimized for the purification of Histidine-tagged proteins and the media are pre-charged with Ni<sup>2+</sup>. Ni Sepharose 6 Fast Flow is designed for fast, reliable scale-up of Histidine-tagged protein purification. The medium is also well suited for batch/gravity flow purification and multi-well plate screening

Ni Sepharose High Performance is optimized for high performance purification of Histidine-tagged proteins with a chromatography system, such as ÄKTAdesign from Amersham Biosciences.

### **Q** What is the protein binding capacity of Ni Sepharose 6 Fast Flow?

Dynamic binding capacity: Approximately 40 mg (His)<sub>6</sub>-tagged protein/ml medium

#### Dynamic binding capacity conditions:

Α

| Sample:         | 1 mg/ml (His) <sub>6</sub> -tagged pure protein (M <sub>r</sub> 43 000) in binding<br>buffer (QB <sub>10%</sub> determination) or (His) <sub>6</sub> -tagged protein<br>(M <sub>r</sub> 28 000) bound from <i>E. coli</i> extract |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Column volume:  | 0.25 ml or 1 ml                                                                                                                                                                                                                   |
| Flow rate:      | 0.25 ml/min or 1 ml/min                                                                                                                                                                                                           |
| Binding buffer: | 20 mM sodium phosphate, 0.5 M NaCl, 5 mM imidazole, pH 7.4                                                                                                                                                                        |
| Elution buffer: | 20 mM sodium phosphate, 0.5 M NaCl, 500 mM imidazole, pH 7.4                                                                                                                                                                      |

Note: Dynamic binding capacity is protein dependent.

### **Q** What are the general running conditions recommended?

### A Recommended starting conditions:

| 5               | 20 mM sodium phosphate, 0.5 M NaCl,<br>20–40 mM imidazole, pH 7.4 |  |
|-----------------|-------------------------------------------------------------------|--|
| Elution buffer: | 20 mM sodium phosphate, 0.5 M NaCl,<br>500 mM imidazole, pH 7.4   |  |

**Note:** The concentration of imidazole that will give optimal purification results (in terms of purity and yield) is protein-dependent, and is usually slightly higher for Ni Sepharose 6 Fast Flow than for similar IMAC media on the market. This can be useful during the washing step as a higher concentration of imidazole in the wash buffer may wash out contaminants that have bound to the medium. This can result in elution of a more pure target protein.

Higher concentration of imidazole will not cause any problems in terms of increased baseline absorbance if a high purity imidazole is used, such imidazole gives essentially no absorbance at 280 nm.

# **Q** Will the high capacity of the new Ni Sepharose 6 Fast Flow result in higher non-specific binding?

A The non-specific binding of proteins is a result of several factors. Other proteins will only bind more to Ni Sepharose 6 Fast Flow if these non-specific proteins are interacting directly with the Ni<sup>2+</sup> or the metal chelating ligand. In addition, non-specific proteins can potentially be washed off at higher concentrations of imidazole, while keeping the target protein bound to the medium.

# **Q** With the higher binding capacity, do you have to use harsh conditions to remove the target protein?

A Harsh conditions are not necessary to remove most target proteins. The proteins tested are all eluted below 500 mM imidazole; frequently between 100-300 mM imidazole. The protein is efficiently eluted from the column, resulting in high yields.

# **Q** How many times can you run the Ni Sepharose 6 Fast Flow while maintaining the same capacity?

A This is sample dependent. Reusing Ni Sepharose 6 Fast Flow depends on the nature of the sample. To prevent cross-contamination, only reuse the column when purifying identical Histidine-tagged proteins.

## **Q** How do you measure the amount of Ni<sup>2+</sup> in the eluent?

A This quantitative measurement assay is as follows:

The medium is run with 10 column volumes of a buffer with pH 4.0 and then the Ni<sup>2+</sup> still bound on the column is measured spectroscopically and compared with the amount Ni<sup>2+</sup> loaded.

# **Q** Can you strip and regenerate the Ni Sepharose 6 Fast Flow medium?

The new Ni Sepharose 6 Fast Flow can be stripped with 50 mM EDTA in 20 mM sodium phosphate, 0.5 M NaCl, pH 7.4 and recharged with Ni<sup>2+</sup> or other divalent cations, such as Cu<sup>2+</sup>, Co<sup>2+</sup>, Zi<sup>2+</sup>, etc.

## Q How can I strip and recharge the medium?

A Recommended stripping buffer: 20 mM sodium phosphate, 0.5 M NaCl, 50 mM EDTA, pH 7.4.

- 1. Strip the column by washing with 5–10 column volumes of stripping buffer.
- 2. Wash with 5–10 column volumes of binding buffer.
- 3. Wash with 5–10 column volumes of distilled water.
- 4. Re-charge the column.

### To recharge the water-washed column:

- 1. Load 0.5 column volumes of 0.1 M metal salt solution in distilled water on the column. Metal chloride and sulfate salts, e.g. 0.1 M  $NiSO_4$ , are commonly used.
- 2. Wash with 5 column volumes of distilled water.
- 3. Wash with 5 column volumes of binding buffer.

**Note:** It is important to wash with binding buffer as the last step to get pH correct.

# Q

Α

Α

# How is the Ni<sup>2+</sup> leakage at low pH?

At pH 4, the loss of Ni<sup>2+</sup> is < 5% on Ni Sepharose 6 Fast Flow (reproducible) compared to average 9% for Ni-NTA Superflow from Qiagen (wide batch to batch variations).

Note: Loss of metal ions is more pronounced at lower pH.

# Q My target protein is extremely sensitive to Ni<sup>2+</sup>. How do I reduce the Ni<sup>2+</sup> leakage to a real minimum (below <5 %)?

- A Leakage of Ni<sup>2+</sup> from Ni Sepharose 6 fast Flow is low under all conditions and resistance towards reducing agents is thus high.
  - **Note:** If using buffers/sample including reducing agents it is recommended to perform a blank run *without* reducing agents in the buffers before loading sample (to remove any weakly bound Ni<sup>2+</sup> ions):

Blank run: Use binding and elution buffer without reducing agents

- 1. Wash the column with 5 column volumes of distilled water.
- 2. Wash with 5 column volumes of binding buffer.
- 3. Wash with 5 column volumes of elution buffer.
- 4. Equilibrate with 10 column volumes of binding buffer.

### Q What different additives can I use together with Ni Sepharose 6 Fast Flow, HisPrep™ FF 16/10 and HisTrap™ FF?

A Tests performed in our laboratories show that Ni Sepharose 6 fast Flow is compatible with the following compounds at the concentrations given.

| Reducing agents   | 5 mM DTE<br>5 mM DTT<br>20 mM ß-mercaptoethanol<br>5 mM TCEP<br>10 mM reduced glutathione                                                                               |                                                                                                                  |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| Denaturing agents | 8 M urea*<br>6 M guanidine hydrochloride*                                                                                                                               |                                                                                                                  |
| Detergents        | 2% Triton™ X-100<br>2% Tween™ 20<br>2% NP-40<br>2% cholate<br>1% CHAPS                                                                                                  | Non-ionic detergent<br>Non-ionic detergent<br>Non-ionic detergent<br>Anionic Detergent<br>Zwitterionic Detergent |
| Additives         | 500 mM imidazole<br>20% ethanol<br>50% glycerol<br>100 mM Na2SO4<br>1.5 M NaCl<br>1 mM EDTA**<br>60 mM citrate**                                                        |                                                                                                                  |
| Buffer solutions  | 50 mM sodium phosphate, pH 7.4<br>100 mM Tris-HCl, pH 7.4<br>100 mM Tris-acetate, pH 7.4<br>100 mM HEPES, pH 7.4<br>100 mM MOPS, pH 7.4<br>100 mM sodium acetate, pH 4* |                                                                                                                  |

\* Tested for 1 week at +40 °C

<sup>\*\*</sup> Generally, chelating agent should be used with caution (and only in the sample, not in buffers). Any metal ion stripping may be counteracted by addition of a small excess of MgCl<sub>2</sub> before centrifugation or filtration of the sample. Note that stripping effects may vary with applied sample volume.

**Q** How do I remove imidazole from my target protein after elution?

A If imidazole needs to be removed from the protein, use HiTrap<sup>™</sup> Desalting 5 ml (can be coupled in series to increase the sample volume), a PD-10 column, or HiPrep<sup>™</sup> 26/10 Desalting, depending on the sample volume.

# **Q** Do you see an improved purity (less non-specific binding) with high concentrations of NaCl?

A In most cases, concentration of ions, imidazole, and other additives in the binding and wash buffers will influence the level of non-specific binding. Higher concentrations of NaCl (500 mM) generally reduce the level of non-specific binding.

# **Q** How does DTT affect the performance of Ni Sepharose 6 Fast Flow in comparison to nickel media from other tested suppliers?

A DTT has a drastic effect on the colour and performance of nickel medium from other tested suppliers, so DTT is generally avoided.

For Ni Sepharose 6 Fast Flow, however, DTT has been tested up to 5 mM and does not affect the binding capacity or nickel ion leakage of the Ni Sepharose 6 Fast Flow. There is no effect on the performance of the medium, although color changes can be evident over 3mM DTT. Therefore, it is essential to perform a blank run before loading sample/ buffers including DTT (and other reducing agents).

Blank run: Use binding and elution buffer *without* reducing agents

- 1. Wash the column with 5 column volumes of distilled water.
- 2. Wash with 5 column volumes of binding buffer.
- 3. Wash with 5 column volumes of elution buffer.
- 4. Equilibrate with 10 column volumes of binding buffer.

# **Q** Is it possible to use high concentrations of Tris-HCl buffer and how does this compatibility to Tris buffers compare to other suppliers?

A These are the Tris buffers systems that have been tested and work well.

50 mM Tris-HCl, pH 7.4

100 mM Tris-HCl, pH 7.4

100 mM Tris-acetate, pH 7.4

Tris buffers in high concentrations can adversely affect the binding of Histidine-tagged target proteins to nickel medium from other suppliers; therefore, lower concentrations of Tris buffers (less than 50 mM) or phosphate buffers are generally used.

## Q How can I clean Ni Sepharose 6 Fast Flow?

- Note: Strip off the metal ions before cleaning (to prevent precipitation of metal salt)
  - To remove precipitated proteins, hydrophobically bound proteins and lipoproteins:
  - 1. Wash the column with 1 M NaOH, contact time usually 1–2 hours (12 hours or more for endotoxin removal).
  - 2. Wash the column with approximately 10 column volumes of binding buffer.
  - 3. Wash the column with 5–10 column volumes of distilled water.
- To remove strongly hydrophobically bound proteins, lipoproteins and lipids:
- 1. Wash the column with 5–10 column volumes 30% isopropanol for about 15–20 minutes.
- 2. Wash the column with approximately 10 column volumes of distilled water.
- 3. Re-charge the medium or wash with 5 column volumes 20% ethanol for storage.

### Alternatively:

Α

- 1. Wash the column with 2 column volumes of detergent in a basic or acidic solution. Use, for example, 0.1–0.5% nonionic detergent in 0.1 M acetic acid, contact time 1–2 hours.
- 2. After treatment, always remove residual detergent by washing with 5 column volumes of 70% ethanol.
- 3. Wash the column with approximately 10 column volumes of distilled water.
- 4. Re-charge the medium or wash with 5 column volumes 20% ethanol for storage.
- To remove ionically bound proteins:
- 1. Washing the column with 1.5 M NaCl solution, contact time 10–15 minutes.
- 2. Wash the column with approximately 10 column volumes of distilled water.
- 3. Re-charge the medium or wash with 5 column volumes 20% ethanol for storage.

# Q Is it possible to use the new Ni Sepharose 6 Fast Flow by gravity or in 96 or 384 well multi-well plates for screening?

A Yes, the performance by gravity flow has been tested. The new Ni Sepharose 6 Fast Flow can be used to fill empty gravity columns and multi-well plates.

### Q A

# Do the new HisTrap FF columns have Valco fittings?

Yes. This makes it possible to put these columns directly into ÄKTAdesign™ without any extra connectors.
